

IRA Apprenticeship Compliance Dashboard

A Tableau dashboard I built to keep utility-scale solar projects compliant with Inflation Reduction Act apprenticeship rules—protecting eligibility for major tax credits by making labor-ratio risk visible before it became a financial problem.

My role: Owned it end-to-end—defined the business logic, validated the data in Snowflake with SQL, and designed the dashboard from raw workforce data to executive-ready reporting.

The challenge: IRA rules require a minimum apprentice-to-journeyworker ratio by craft each day. Miss it, and labor hours can be disqualified—putting significant tax credits at risk across multiple jobsites and reporting periods.

What I built: A single dashboard that gives leadership an at-a-glance compliance read, flags ratio exceptions by project and craft, and drills down to employee-level detail for audit and payroll validation—backed by data logic I helped define and validate in Snowflake.

Impact

- Monitored compliance across 125+ active projects, 3,000+ workers, and 1.9M+ labor hours from a single view
- Helped the largest client exceed the 15% apprenticeship-hours threshold and preserve eligibility for major IRA tax credits
- Turned reactive spreadsheet reporting into proactive, exception-based monitoring
- Adopted as the reporting standard for current and future IRA-regulated projects
- Strengthened the shared data source so it now supports reporting beyond this dashboard

Tools & skills: Tableau · SQL / Snowflake · multi-source data blending · compliance & exception reporting · KPI design · cross-functional collaboration.
